

REPUBLIC OF THE PHILIPPINES  
**NATIONAL DISASTER RISK REDUCTION AND MANAGEMENT COUNCIL**

National Disaster Risk Reduction and Management Center, Camp Aguinaldo, Quezon City, Philippines

**NDRRMC ADVISORY**

**TO :** CHAIRPERSONS, RDRRMCs/OCD CALABARZON, V and VI  
**FROM :** Executive Director, NDRRMC and Administrator, OCD  
**SUBJECT :** Taal, Mayon and Kanlaon Volcano Bulletin

**DATE :** 02 April 2020, 8:00 AM

Source: DOST-PHIVOLCS 02 April 2020, 08:00 AM

**I. SITUATION OVERVIEW**

**A. ALERT STATUS OF TAAL VOLCANO**

Activity in the Main Crater in the past 24 hours has been characterized by weak emission of white to dirty white steam-laden plumes rising 50 meters high before drifting southwest. Weak steaming was also observed from fissure vents along the Daang Kastila trail. The Taal Volcano Network recorded twelve (12) volcanic earthquakes that are associated with rock fracturing processes beneath and around the edifice.

**Alert Level 1 (Abnormal)** is maintained over Taal Volcano. DOST-PHIVOLCS reminds the public that at Alert Level 1, sudden steam-driven or phreatic explosions, volcanic earthquakes, minor ashfall and lethal accumulations or expulsions of volcanic gas can occur and threaten areas within the Taal Volcano Island (TVI). DOST-PHIVOLCS strongly recommends that entry into TVI, Taal's Permanent Danger Zone or PDZ, especially the vicinities of the Main Crater and the Daang Kastila fissure, must remain strictly prohibited. Local government units are advised to continuously assess previously evacuated barangays around Taal Lake for damages and road accessibilities and to strengthen preparedness, contingency and communication measures in case of renewed unrest. People are also advised to observe precautions due to ground displacement across fissures, possible ashfall and minor earthquakes. Civil aviation authorities must advise pilots to avoid flying close to the volcano as airborne ash and ballistic fragments from sudden explosions and wind-remobilized ash may pose hazards to aircrafts. DOST-PHIVOLCS is closely monitoring Taal Volcano's activity and any new significant development will be immediately communicated to all stakeholders.

**B. ALERT STATUS OF MAYON VOLCANO**

Mayon Volcano's seismic monitoring network recorded two (2) volcanic earthquakes and one (1) rockfall event during the 24-hour observation period. Moderate emission of white steam-laden plumes that crept downslope before drifting west, west-northwest, and west-southwest was observed. Faint crater glow from the summit could be observed at night. Sulfur dioxide (SO<sub>2</sub>) emission was measured at an average of 418 tonnes/day on 30 March 2020. Recent electronic tilt data showed inflation of the middle to upper portions of the volcanic edifice that began in the last

quarter of 2019. This follows an inflationary trend that began in February 2019 as recorded by continuous GPS monitoring.

**DOST-PHIVOLCS reiterates that Alert Level 2 currently prevails over Mayon because the volcano is at a moderate level of unrest.** It is therefore strongly recommended that entry into the six kilometer-radius Permanent Danger Zone or PDZ and a precautionary seven kilometer-radius Extended Danger Zone or EDZ in the south-southwest to east-northeast sector, stretching from Anoling, Camalig to Sta. Misericordia, Sto. Domingo should be strictly prohibited. The public is reminded that sudden explosions, lava collapse, pyroclastic density currents or PDCs and ashfall can occur without warning and threaten areas in the upper to middle slopes of Mayon. People residing close to these danger areas are also advised to observe precautions against rockfalls, PDCs, and ashfall. Active stream/river channels and those identified as perennially lahar-prone areas on all sectors of the volcano should also be avoided especially during extreme weather conditions when there is heavy and prolonged rainfall. Civil aviation authorities must advise pilots to avoid flying close to the volcano's summit as airborne ash and ballistic fragments from sudden explosions and PDCs may pose hazards to aircraft.

DOST-PHIVOLCS is closely monitoring Mayon Volcano's condition and any new development will be relayed to all concerned.

### **C. ALERT STATUS OF KANLAON VOLCANO**

Kanlaon Volcano's seismic monitoring network recorded thirteen (13) volcanic earthquakes during the 24-hour observation period. Ground deformation data from continuous GPS measurements indicate a period of long-term slow inflation of the edifice since 2017, while short-term electronic tilt monitoring on the southeastern flanks recorded slow inflation of the lower slopes since May 2019 and pronounced inflation of the upper slopes at the end of January 2020. These parameters indicate that hydrothermal or magmatic activity is occurring deep beneath the edifice.

**Alert Level 1 (abnormal)** status prevails over Kanlaon Volcano, which means that it is at an abnormal condition and has entered a period of unrest. The local government units and the public are strongly reminded that entry into the 4-kilometer radius Permanent Danger Zone (PDZ) must be strictly prohibited due to the further possibilities of sudden and hazardous steam-driven or phreatic eruptions. Civil aviation authorities must also advise pilots to avoid flying close to the volcano's summit as ejecta from any sudden phreatic eruption can be hazardous to aircraft. DOST-PHIVOLCS is closely monitoring Kanlaon Volcano's activity and any new development will be relayed to all concerned.

Let's untiringly aim for zero casualty.

Submit report on actions taken.

**BY AUTHORITY OF THE CHAIRPERSON, NDRRMC:**

  
**UNDERSECRETARY RICARDO B JALAD**  
Executive Director, NDRRMC and  
Administrator, OCD
