

Situational Report for the Mayon Volcanic Activity (2023)

SitRep No. 21 for the Mayon Volcanic Activity (2023)

June 29, 2023 08:00 am

On 05 June 2023, the alert status of Mayon Volcano was raised to Alert Level 2 (Increasing Unrest) following a sharp increase in the incidence of rockfall from its summit lava dome from an average of 5 events per day in May 2023 to 49 events per day on 5 June 2023.

Pronounced increases in rockfall signify the extrusion of new lava beneath the summit lava dome, destabilizing this and causing its spalling or collapse.

Rockfall activity increased while volcanic earthquake activity was absent to sparse, sulfur dioxide (SO₂) emissions were at background or baseline levels and short-term ground deformation consisted mainly of swelling of the middle to upper slopes of the edifice

Days of increased incidence and volume of rockfall based on seismic records were followed by the generation of short pyroclastic density currents (PDCs) or "uson" in the morning of 08 June 2023. The PDCs were emplaced on the Bonga (Legazpi City), Miisi (Daraga) and Basud (Sto. Domingo) Gullies as far as two (2) kilometers from the summit crater. This indicated that new, less degassed lava was already being spalled from the summit dome and that eruption of very slowly extruding magma had slightly increased.

On 08 June 2023, 12:00 PM, Alert Level 3 (Increased Tendency Towards Hazardous Eruption) was raised. In the evening thereof, incandescent rockfall generated by intermittent collapse of an apparent fluidal lava portion of the summit dome were deposited on the above gullies within a kilometer of the crater.

In the early morning on 10 June 2023, a new summit dome impinging a remnant on the southeast crater floor was observed.

As of 10 June 2023, 7:00 PM, a total of 654 rockfall events and 7 PDCs have been recorded by the Mayon Volcano Network since 01 June 2023. Average SO₂ flux increased beyond baseline levels to 1,205 tonnes/day. All other monitoring parameters remain unchanged.

Fair crater glow or "banaag" and incandescent rockfall shed from new fluidal lava at the summit of Mayon Volcano was observed in the night of 10 June 2023.

On 11 June 2023, at around 7:47 PM, lava flow activity commenced from the summit crater of Mayon Volcano. The activity formed two lobes of lava that emplaced within 500 meters from the crater and shed lava debris on the Mi-Isi (south) and Bonga (southeastern), and Basud (eastern) Gullies that fell within 2 kilometers from the crater. This development was accompanied by only weak seismic activity and a slight swelling of the upper portions of the edifice prior to lava flow based on electronic tilt data.

From 11 June 2023, 5:00 AM to 12 June 2023, 5:00 AM, the Mayon Volcano Network recorded twenty-one (21) weak volcanic earthquakes and two hundred sixty (260) rockfall events. Three (3) dome-collapse PDC that lasted 2 to 4 minutes were also detected. SO₂ emission averaged 642 tonnes/day on 11 June 2023.

From 12 June 2023, 5:00 AM to 13 June 2023, 5:00 AM, the Mayon Volcano Network recorded one (1) volcanic earthquake and 221 rockfall events based on seismic and visual observations. Very slow effusion of lava from the summit crater emplaced lava flow and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies within approximately a kilometer from the crater. One (1) dome-collapse PDC that lasted two (2) minutes was also detected via seismic signals and was visually observed. Thin ash from the rockfalls and continuous moderate degassing from the summit crater produced steam-laden plumes that bent and crept downslope before drifting northeast. Fair crater glow or "banaag" and incandescent rockfall shed from new fluidal lava at the summit of Mayon Volcano was observed. Sulfur dioxide (SO₂) emission averaged 723 tonnes/day on 12 June 2023.

From 13 June 2023, 5:00 AM to 14 June 2023, 5:00 AM, the Mayon Volcano Network recorded seven (7) volcanic earthquakes and 309 rockfall events based on seismic and visual observations. Very slow effusion of lava from the summit crater emplaced lava flow and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies within approximately a kilometer from the crater. Seven (7) dome-collapse PDC that lasted four (4) minutes were also detected via seismic signals and were visually observed. Thin ash from the rockfalls and continuous moderate degassing from the summit crater produced steam-laden plumes that bent and crept downslope before drifting general east. Fair crater glow or “banaag” and incandescent rockfall shed from new fluidal lava at the summit of Mayon Volcano was observed. Sulfur dioxide (SO₂) emission averaged 149 tonnes/day on 13 June 2023.

From 14 June 2023, 5:00 AM to 15 June 2023, 5:00 AM the Mayon Volcano Network recorded two (2) volcanic earthquakes and 306 rockfall events based on seismic and visual observations. Very slow effusion of lava from the summit crater emplaced lava flow and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies within approximately a kilometer from the crater. Three (3) dome-collapse PDC that lasted three (3) to six (6) minutes were also detected. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 700 m before drifting northwest. Fair crater glow or “banaag” and incandescent rockfall shed from fluidal lava at the summit of Mayon Volcano was observed. Sulfur dioxide (SO₂) emission averaged 193 tonnes/day on 14 June 2023.

From 15 June 2023, 5:00 AM to 16 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to approximately one (1) kilometer from the summit crater while collapse debris have deposited to two (2) kilometers from the crater. A total of 13 dome-collapse PDC, 307 rockfall events, and four (4) volcanic earthquakes were recorded by the Mayon Volcano Network. PDCs lasted two (2) to six (6) minutes and were emplaced on the Mi-isi and Bonga Gullies within one (1) kilometer of the crater. The largest PDC event since 8 Jun 2023 occurred at 11:18 PM on 15 June and deposited material within the upper one (1) kilometer of these gullies. Traces of ashfall dispersed from the PDCs were reported in Sitio Buga, Brgy. Nabonton, City of Ligao and Purok 7, Brgy. San Francisco, Municipality of Guinobatan. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 750 m before drifting to the general west and north-northeast. Sulfur dioxide (SO₂) emission averaged 826 tonnes/day on 15 June 2023.

From 16 June 2023, 5:00 AM to 17 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of one thousand five hundred (1500) meters from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of nine (9) dome-collapse pyroclastic density currents (PDC) that lasted two (2) to four (4) minutes, two-hundred eighty (280) rockfall events, and two (2) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 100 m before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 978 tonnes/day on 16 June 2023.

From 17 June 2023, 5:00 AM to 18 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of one thousand five hundred (1500) meters from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of eleven (11) dome-collapse pyroclastic density currents (PDC) that lasted two (2) to six (6) minutes, two hundred seventy-four (274) rockfall events, and three (3) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 100 m before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 1,004 tonnes/day on 17 June 2023.

From 18 June 2023, 5:00 AM to 19 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of one thousand five hundred (1500) meters from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of five (5) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes and two hundred sixty five (265) rockfall events were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 600 m before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 889 tonnes/day on 18 June 2023.

From 19 June 2023, 5:00 AM to 20 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of two thousand five hundred (2500) meters and one thousand eight hundred (1800) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of two (2) dome-collapse pyroclastic density currents

(PDC) that lasted two (2) to three (3) minutes, three hundred one (301) rockfall events, and one (1) volcanic earthquake were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 800 m before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 389 tonnes/day on 19 June 2023.

From 20 June 2023, 5:00 AM to 21 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of two thousand five hundred (2500) meters and one thousand eight hundred (1800) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of seven (7) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, two hundred ninety-nine (299) rockfall events, and two (2) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 800 meters before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 507 tonnes/day on 20 June 2023.

From 21 June 2023, 5:00 AM to 22 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of two thousand five hundred (2500) meters and one thousand eight hundred (1800) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of eight (8) dome-collapse pyroclastic density currents (PDC) that lasted two (2) to five (5) minutes and two hundred ninety-nine (299) rockfall events were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 750 meters before drifting southwest. Sulfur dioxide (SO₂) emission averaged 574 tonnes/day on 21 June 2023.

From 22 June 2023, 5:00 AM to 23 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of two thousand five hundred (2500) meters and one thousand eight hundred (1800) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of thirteen (13) dome-collapse pyroclastic density currents (PDC) that lasted one (1) to four (4) minutes and three hundred thirty-nine (339) rockfall events were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 750 meters before drifting southwest and west-southwest. Sulfur dioxide (SO₂) emission averaged 706 tonnes/day on 22 June 2023.

From 23 June 2023, 5:00 AM to 24 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of 2,500 meters and 1,800 meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to 3,300 meters from the crater. A total of one (1) dome-collapse PDC that lasted three (3) minutes, 308 rockfall events, and two (2) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 600 meters before drifting southwest. Sulfur dioxide (SO₂) emission averaged 744 tonnes/day on 23 June 2023.

As of 24 June 2023, 5:00 AM to 25 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of 2,500 meters and 1,800 meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to 3,300 meters from the crater. A total of 16 dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, 257 rockfall events, and 24 volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 600 meters before drifting west-southwest and southwest. Sulfur dioxide (SO₂) emission averaged 663 tonnes/day on 24 June 2023.

As of 25 June 2023, 5:00 AM to 26 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to approximate lengths of one thousand three hundred (1300) meters and one thousand two hundred (1200) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of eight (8) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, two hundred sixty-three (263) rockfall events, and one hundred two (102) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 100 meters before drifting to the general west direction. Sulfur dioxide (SO₂) emission averaged 925 tonnes/day on 25 June 2023.

On 26 June 2023, 4:00 PM, there was an increased seismic activity and ground deformation in Mayon Volcano. Eruptive activity has been dominated by weak aseismic effusion of degassed lava from the summit crater. However, an increasing number of weak and shallow volcanic earthquakes began on 24 June 2023 and steadily increased to 102 volcanic earthquakes during a 24-hour between 25 and 26 June 2023. Between 5:00 AM and 3:00 PM today, an additional 100 volcanic earthquakes were recorded. Some of the analyzed earthquakes that could be located emanated from the summit lava dome, indicating origins from lava extrusion processes at the crater. The increased seismicity was accompanied by a noticeable sharp jump in ground tilt on the southwest sector of the edifice that began on 25 June 2023. As of present, steady-rate lava effusion from the summit crater and sporadic generation of rockfall and pyroclastic density currents or PDCs still persist.

As of 26 June 2023, 5:00 AM to 27 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to approximate lengths of one thousand three hundred (1600) meters and one thousand two hundred (1200) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of seventeen (17) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, two hundred forty-one (241) rockfall events, and one hundred seven (107) volcanic earthquakes were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 750 meters before drifting to the general west direction. Sulfur dioxide (SO₂) emission averaged 753 tonnes/day on 26 June 2023. Short-term observations from EDM and electronic tiltmeter monitoring show the upper slopes to be inflating since February 2023. Longer-term ground deformation parameters based on EDM, precise leveling, continuous GPS, and electronic tilt monitoring indicate that Mayon is still inflated, especially on the northwest and southeast.

As of 27 June 2023, 5:00 AM to 28 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to approximate lengths of one thousand six hundred (1600) meters and one thousand two hundred (1200) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of seven (7) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, three hundred seventy-two (372) rockfall events, and one (1) volcanic earthquake were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 800 meters before drifting to west-northwest direction. Sulfur dioxide (SO₂) emission averaged 964 tonnes/day on 27 June 2023.

As of 28 June 2023, 5:00 AM to 29 June 2023, 5:00 AM, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to approximate lengths of two thousand one hundred (2100) meters and one thousand three hundred (1300) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris has deposited to three thousand three hundred (3300) meters from the crater. A total of seven (7) dome-collapse pyroclastic density currents (PDC) that lasted three (3) minutes, two (2) lava front collapse pyroclastic density currents (PDC) that generated 1000 meters high light-brown plume, two hundred ninety-six (296) rockfall events, and one (1) volcanic earthquake were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 1000 meters before drifting to west-northwest, north-northwest, and northeast direction. Sulfur dioxide (SO₂) emission averaged 595 tonnes/day on 28 June 2023.

As of 29 June 2023, 8:00 AM, Mayon Volcano is at Alert Level 3 which means that it is currently in a relatively high level of unrest as magma is at the crater and hazardous eruption is possible within weeks or even days.

AFFECTED POPULATION

A total of 10,655 families or 41,532 persons were affected. Of which, 5,365 families or 18,754 persons were served inside 28 ECs and 408 families or 1,427 persons were served outside ECs:

Affected Regions	AFFECTED			INSIDE ECs			OUTSIDE ECs	
	Brgy	Families	Persons	No. of ECs	Families	Persons	Families	Persons
TOTAL	26	10,655	41,532	28	5,365	18,754	408	1,427
Region 5	26	10,655	41,532	28	5,365	18,754	408	1,427
