Kanlaon Volcanic Activity

SitRep No. 26 for Kanlaon Volcanic Activity (2024)

September 22, 2024 08:00 am

On 03 June 2024, at 6:51 PM, a moderately explosive eruption occurred at the summit crater of Kanlaon Volcano. The event was recorded as an E-type earthquake that lasted six (6) minutes based on seismic data and produced a five (5) kilometer-high voluminous eruption plume. Thermal camera monitors showed material collapsing from the incandescent plume forming pyroclastic density currents or PDCs that descended the southern slopes to a distance of two (2) to three (3) kilometers. Incandescent ballistic ejecta were also observed to rain down from the eruption plume. Rumbling sounds generated by the eruption were heard in La Castellana and La Carlota City, Negros Occidental and Canlaon City, Negros Oriental. Coarse ashfall reportedly fell upon barangays of these same areas and Bago City, Negros Occidental. Sulfurous odors were also experienced by residents in these areas as well as in Kanlaon Volcano Observatory-La Carlota City (KVO-LCC) and as far away as Murcia, Negros Occidental and Bacolod City.

In view thereof, DOST-PHIVOLCS raised the Alert Level of Kanlaon Volcano from Alert Level 1 (abnormal) to Alert Level 2 (increasing unrest). This means that there is current unrest driven by shallow magmatic processes that could eventually lead to further explosive eruptions or even precede hazardous magmatic eruptions.

Explosive activity at Kanlaon on 3 June 2024 was immediately succeeded by profuse degassing from the summit crater that waned by 8:20 AM on 4 June 2024 based on camera monitors. Post-eruptive degassing likely entrained volcanic ash that fell as light ashfall on the southwest sector of the volcano as reported by a KVO-LCC survey team. As of 04 June, 12:00 NN, a total of 84 weak low-frequency volcanic earthquakes events have been recorded by the KVN, consistent with current low-level degassing from the Kanlaon crater. SO₂ emission measured by campaign survey has reached 4,113 tonnes/day, the highest flux this year and the second highest ever measured from Kanlaon.

Kanlaon occasionally exhibits phreatic and short-lived explosive eruptions that produce small-magnitude hazards. Of the 43 eruptions recorded since 1866 including this most recent one, only the 1902 eruption was magmatic and associated with the generation of small-volume lava flows on the upper slopes.

On 09 September 2024, 11:30 PM, DOST-PHIVOLCS issued a notice of increased seismic activity at Kanlaon Volcano. A total of twenty-five (25) volcano-tectonic or VT earthquakes have been recorded by the Kanlaon Volcano Network since 8:32 AM this morning, with the last 22 having been recorded beginning 10:35 PM this evening. Canlaon City, Negros Oriental residents report that at least five of these earthquakes were felt. VT earthquakes are generated by rock fracturing processes and the increase in VT activity may possibly precede eruptive activity.

On 10 September 2024, 11:00 AM, DOST-PHIVOLCS issued a notice of increased seismic activity at Kanlaon Volcano. A total of two hundred eighty-eight (288) volcano-tectonic or VT earthquakes have been recorded by the Kanlaon Volcano Network since 08:30 PM of 09 September 2024. The events were generated between 0 to 9 kilometers depths beneath the north-eastern flanks of the volcanic edifice and the strongest events were felt at Intensity II in some barangays of Canlaon City, Negros Oriental. Rumbling sounds were reported by some residents of Bago City. Strong sulfur fumes have been reported in a few barangays in Bago, La Carlota and Canlaon Cities. VT earthquakes are generated by rock fracturing processes and the increase in VT activity strongly indicates progressive rock-fracturing beneath the volcano as rising magma drives a path towards the surface.

At 7:00 pm, DOST-PHIVOLCS issued a notice of elevated volcanic SO₂ gas flux at Kanlaon Volcano. Volcanic sulfur dioxide (SO₂) gas emission from the summit crater of Kanlaon based on campaign Flyspec measurements today, 10 September 2024, averaged 9,985 tonnes/day. This is the highest emission from the volcano recorded since instrumental gas monitoring began. Kanlaon has been degassing increased concentrations of volcanic SO₂ this year at an average rate of 1,273 tonnes/day prior to the 3 June 2024 eruption, but emission since then has been particularly elevated at a current average of 3,468 tonnes/day. Sulfuric odors were reported in the following localities; Brgy. Ilijan, Bago City; Brgy. Ara-al and Brgy. San Miguel, La Carlota City; Brgy. Masulog, Brgy. Linothangan and Brgy. Pula, Canlaon City.

The Alert Level 2 (increasing unrest) still prevails over Kanlaon, but that current activity may lead to eruptive unrest and

an increase in the Alert Level.
